- ▶ Cyclic Redundancy Code

5. Summary

Previous Persistent Fault Attacks (PFA)

ciphertexts: uniform distribution

Previous Persistent Fault Attacks (PFA)

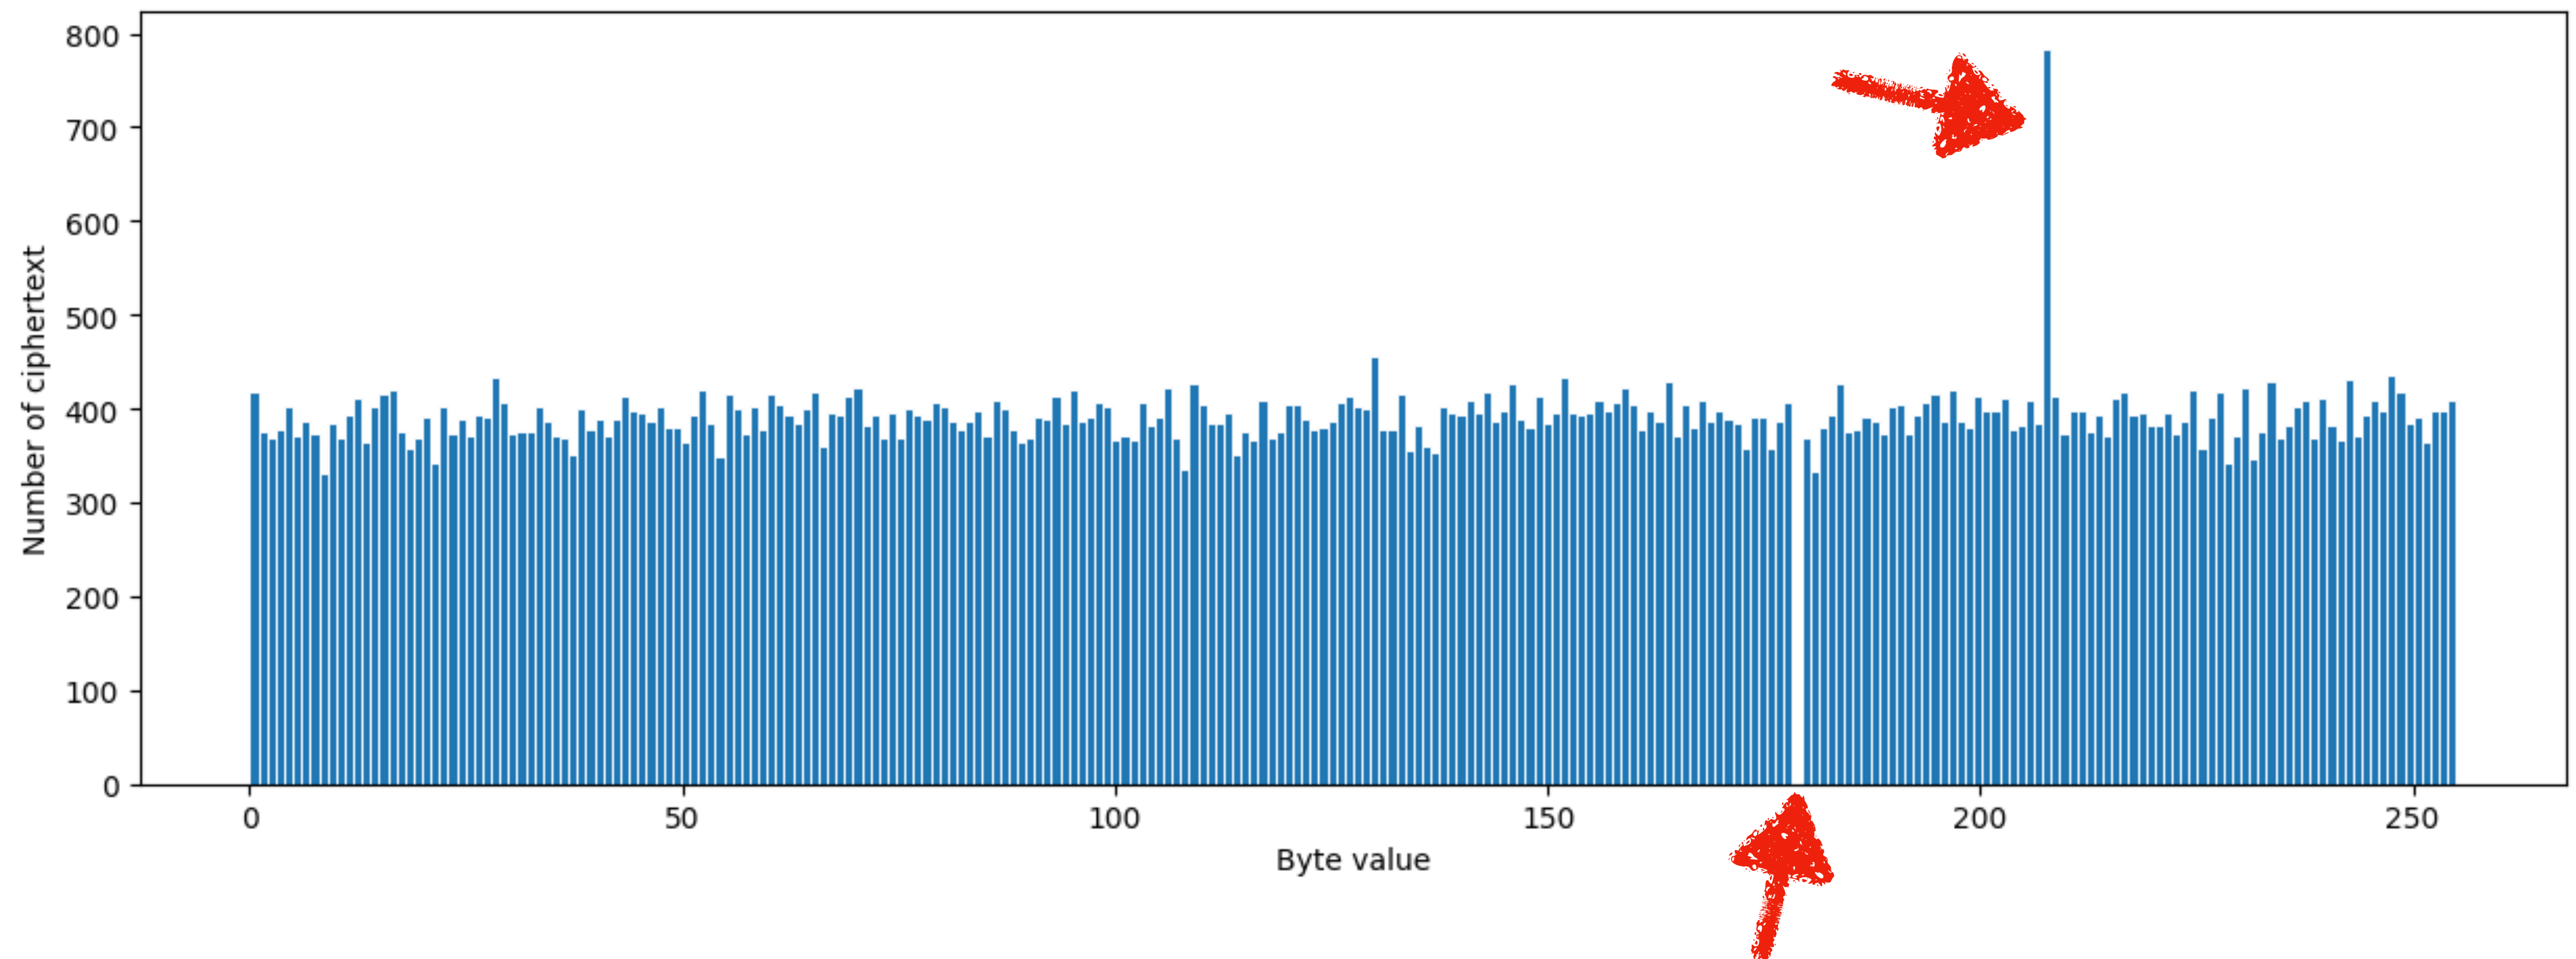

- ✦ Fault on first element: $C \rightarrow 5$
 - ▶ C: disappears
 - ▶ 5: appears twice

ciphertexts: **non-uniform** distribution

Non-uniform Distribution of Ciphertexts

- ◆ Attacks: [Zhang et al., CHES18,20], [Pan et al., DATE19], [Gruber et al., FDTC19], [Engels et al., FDTC20], [Soleimany et al., CHES22]

Research Questions

- ◆ Countermeasures ?
 - ▶ *biased* faulty SBox
- ◆ What if swap 2 elements ?
 - ▶ *non-biased* faulty SBox
 - ▶ possible to recover key ?
- ◆ (Stronger) Countermeasures ?
 - ▶ *both* biased and non-biased faulty SBoxes

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| 5 | 5 | 6 | B | 9 | 0 | A | D |
| 3 | E | F | 8 | 4 | 7 | 1 | 2 |

biased faulty SBox

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| C | 6 | 5 | B | 9 | 0 | A | D |
| 3 | E | F | 8 | 4 | 7 | 1 | 2 |

non-biased faulty SBox

Principle of Countermeasures

- ◆ Ensure the integrity of SBox 
 - ▶ Detect any (?) injected faults 
 - ▶ Make it **impractical** for attacker to successfully inject faults

Outlines

1. Context

- ▶ Previous PFA
- ▶ Our research questions

2. Countermeasures against biased faulty SBoxes

- ▶ BALoo
- ▶ Frequency Checking

3. Linear Cryptanalysis: PRESENT with non-biased faulty SBox

4. Stronger Countermeasures

- ▶ Permutation Network
- ▶ Cyclic Redundancy Code

5. Summary

Countermeasure: BALoo [Tissot et al., 2023]

| | | | | | | | | | | | | | | | | |
|------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| x | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | A | B | C | D | E | F |
| S(x) | C | 5 | 6 | B | 9 | 0 | A | D | 3 | E | F | 8 | 4 | 7 | 1 | 2 |

- ◆ **Redundancy info:**
(stored in non-volatile memory)
 - ▶ Number of cycles
 - ▶ Starting indices
 - ▶ Their lengths
- ◆ **Verify before encryption**

$$S(0) = C, S[C] = 4, \dots$$

Countermeasure: Frequency Check

- ◆ Each element should appear ONCE
- ◆ Example:
 - ▶ $\text{Freq}(6) = 1 \rightarrow \text{OK}$
 - ▶ $\text{Freq}(5) = 2 \rightarrow \text{fault detected}$
- ◆ Not require redundancy info

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| 5 | 5 | 6 | B | 9 | 0 | A | D |
| 3 | E | F | 8 | 4 | 7 | 1 | 2 |

biased faulty SBox

BALoo and Frequency Check

◆ Efficiency:

- ▶ detect any *biased* faulty SBoxes ✓
- ▶ prevent attacks in prior works ✓

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| 5 | 5 | 6 | B | 9 | 0 | A | D |
| 3 | E | F | 8 | 4 | 7 | 1 | 2 |

biased faulty SBox

But...can we bypass them ? 🤔

◆ YES !!! 😈

1110 ↔ 0110
2 bitflips

4 bitflips

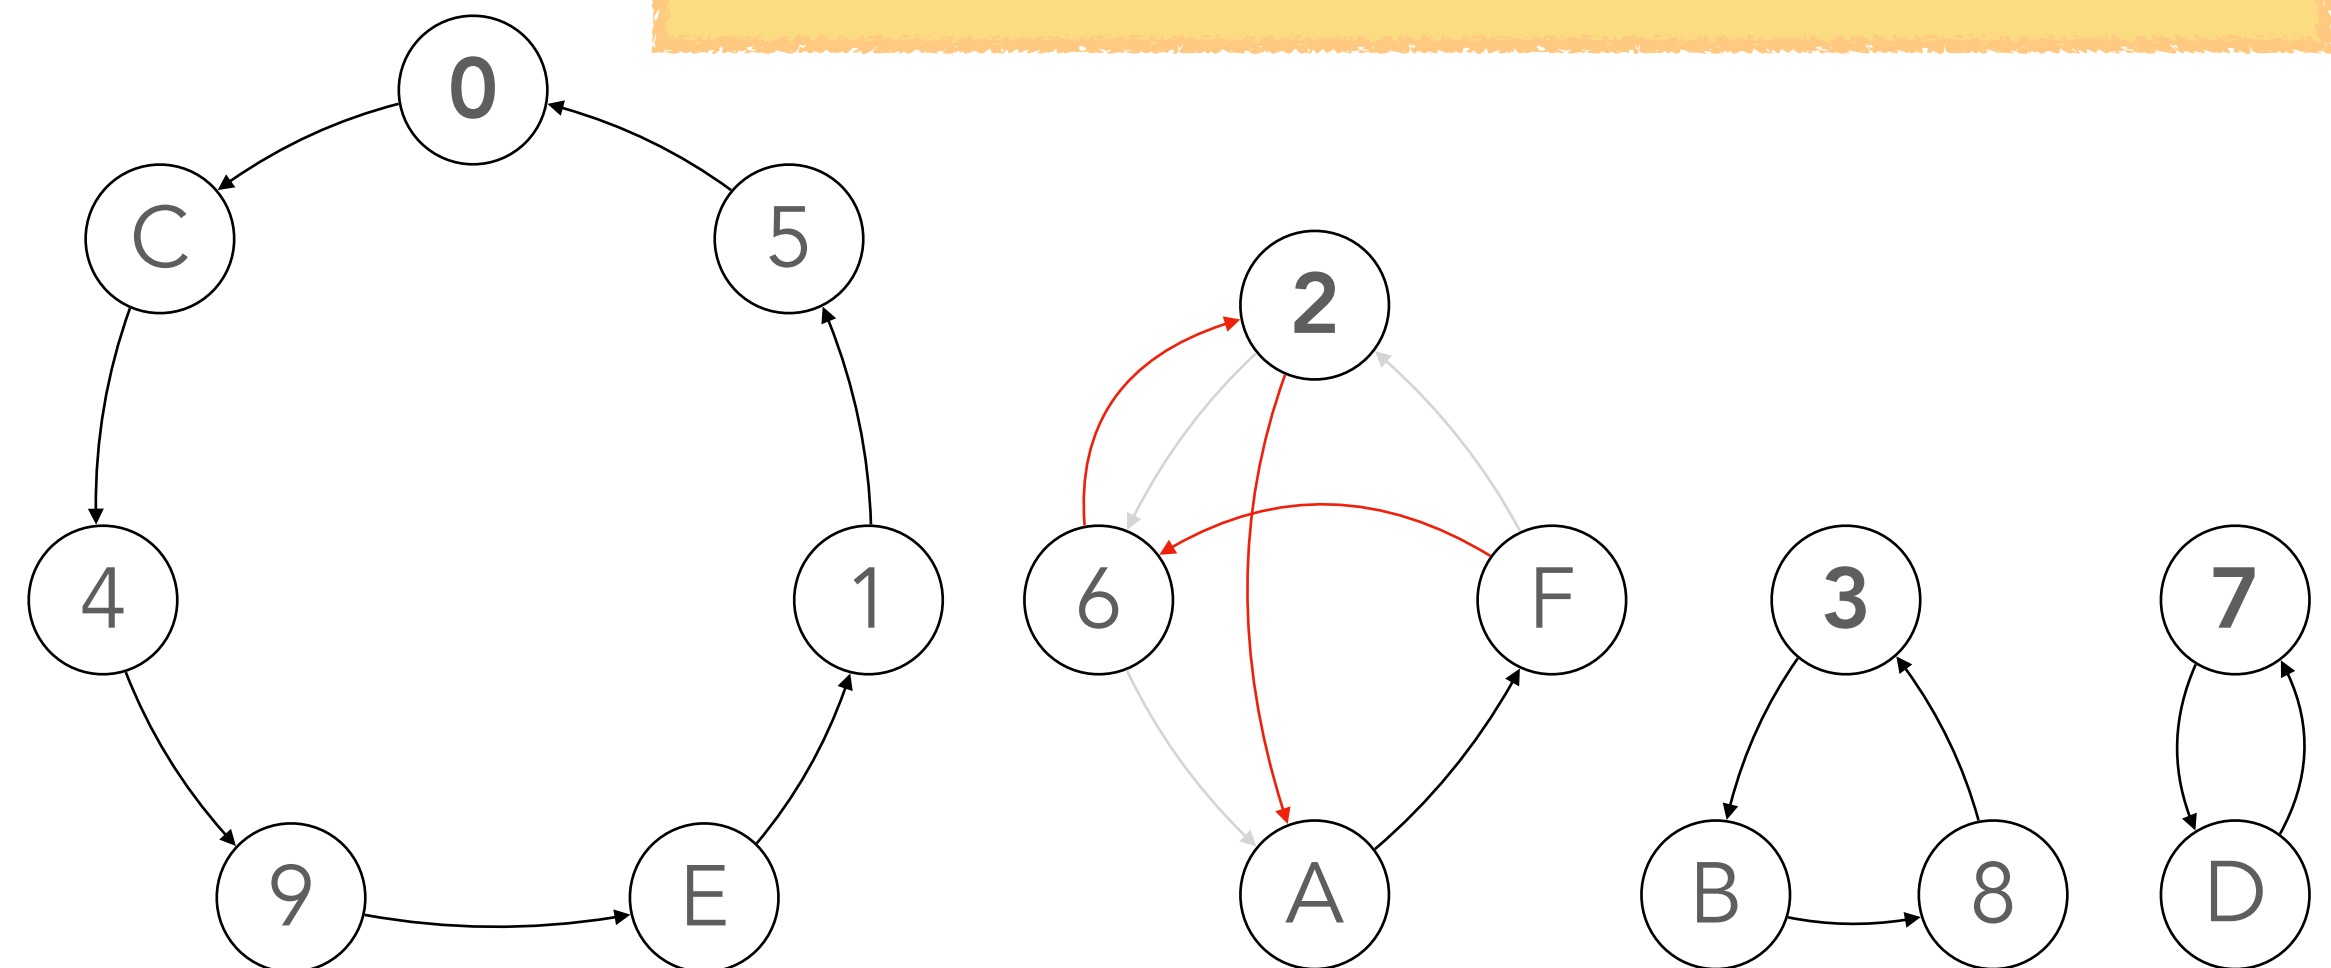

| | | | | | | | |
|---|----------|----------|---|---|---|---|---|
| C | 5 | E | B | 9 | 0 | A | D |
| 3 | 6 | F | 8 | 4 | 7 | 1 | 2 |

non-biased faulty SBox

| | | | | | | | |
|---|---|----------|---|---|---|----------|----------|
| C | 5 | A | B | 9 | 0 | 2 | D |
| 3 | E | F | 8 | 4 | 7 | 1 | 6 |

non-biased faulty SBox

Freq(**E**) = 1 → OK
Freq(**6**) = 1 → OK

OK! Bypass...then what next ? 🤔

◆ Prior attacks are still applicable ?

▶ NO 😡

▶ **Non-biased** faulty SBox → **still uniform** ciphertexts

◆ New attack ? 🤔

▶ YES (but very classical, not new) 😡

▶ Linear Cryptanalysis

Outlines

1. Context

- ▶ Previous PFA
- ▶ Our research questions

2. Countermeasures against biased faulty SBoxes

- ▶ BALoo
- ▶ Frequency Checking

3. Linear Cryptanalysis: PRESENT with non-biased faulty SBox

4. Stronger Countermeasures

- ▶ Permutation Network
- ▶ Cyclic Redundancy Code

5. Summary

Classical Linear Cryptanalysis [Matsui, CRYPTO94]

- ◆ Find a good linear approximation
- ◆ Use statistical analysis
 - ▶ many plaintext-ciphertext pairs
- ◆ Recover part of key

Linear Approximation Table: 1-bit LAT

mask: $u = 1000_2 = 8$

mask: $v = 1000_2 = 8$

mask: $u = 1000_2 = 8$

mask: $v = 0100_2 = 4$

LAT (biases): $\#\{x \in \mathbb{F}_2^4 : u \cdot x = v \cdot S[x]\} - 8$

| $u \setminus v$ | 1 | 2 | 4 | 8 |
|-----------------|---|----|----|----|
| 1 | 0 | 0 | 0 | 0 |
| 2 | 0 | 2 | -2 | 2 |
| 4 | 0 | -2 | -2 | -2 |
| 8 | 0 | 2 | 0 | -2 |

| x | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | A | B | C | D | E | F |
|------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| S(x) | C | 5 | 6 | B | 9 | 0 | A | D | 3 | E | F | 8 | 4 | 7 | 1 | 2 |

Linear Approximation Table: 1-bit LAT

| | | | | | | | | | | | | | | | | |
|------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| x | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | A | B | C | D | E | F |
| S(x) | C | 5 | 6 | B | 9 | 0 | A | D | 3 | E | F | 8 | 4 | 7 | 1 | 2 |

original

| | | | | | | | | | | | | | | | | |
|------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| x | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | A | B | C | D | E | F |
| S(x) | C | 5 | 6 | B | 9 | 0 | A | 3 | D | E | F | 8 | 4 | 7 | 1 | 2 |

2 swaps

| | | | | | | | | | | | | | | | | |
|------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| x | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | A | B | C | D | E | F |
| S(x) | C | 5 | F | B | 9 | 0 | A | D | 3 | E | 2 | 8 | 4 | 7 | 1 | 6 |

3 swaps

| | | | | |
|-----|---|----|----|----|
| u\v | 1 | 2 | 4 | 8 |
| 1 | 0 | 0 | 0 | 0 |
| 2 | 0 | 2 | -2 | 2 |
| 4 | 0 | -2 | -2 | -2 |
| 8 | 0 | 2 | 0 | -2 |

| | | | | |
|-----|---|---|----|----|
| u\v | 1 | 2 | 4 | 8 |
| 1 | 0 | 2 | -2 | -2 |
| 2 | 0 | 4 | -4 | 0 |
| 4 | 0 | 0 | -4 | -4 |
| 8 | 0 | 0 | 2 | 0 |

| | | | | |
|-----|----|----|----|----|
| u\v | 1 | 2 | 4 | 8 |
| 1 | 0 | 0 | 2 | 0 |
| 2 | 0 | 2 | -2 | 2 |
| 4 | 0 | -2 | 0 | -2 |
| 8 | -2 | 2 | 0 | -4 |

seems very vulnerable !!! 😈

Complexity Estimation [Nyberg et al., FSE17]

◆ Success probability:

$$P_S = 2 - 2\Phi \left(\sqrt{\frac{1/N + \text{ELP}}{1/N + 2^{-b}}} \Phi^{-1}(1 - 2^{-a-b}) \right)$$

◆ Data complexity:

$$N = \frac{\Phi^{-1}(1 - 2^{-a-1})^2 - \Phi^{-1}(1 - P_S/2)^2}{\text{ELP} \cdot \Phi^{-1}(1 - P_S/2)^2 - 2^{-|K|} \Phi^{-1}(1 - 2^{-a-1})^2}$$

◆ For PRESENT:

- ▶ $b = 64$: block size
- ▶ $|K| = 80$: key size

◆ Estimated Linear Potential (ELP):

- ▶ derived from 1-bit LAT
- ▶ computed over 28 rounds (out of 31)

◆ a : number of advantage bits

- ▶ recover a bits by linear attack
- ▶ only need to brute-force $|K| - a$ bits

relations between a, P_S, N ? 🤔

Attack on full-round PRESENT

$a = 10$

$a = 20$

Attack on full-round PRESENT

$a = 30$

$a = 40$

Outlines

1. Context

- ▶ Previous PFA
- ▶ Our research questions

2. Countermeasures against biased faulty SBoxes

- ▶ BALoo
- ▶ Frequency Checking

3. Linear Cryptanalysis: PRESENT with non-biased faulty SBox

4. Stronger Countermeasures

- ▶ Permutation Network
- ▶ Cyclic Redundancy Code

5. Summary

Permutation Network [Beneš, 1964]

data flow

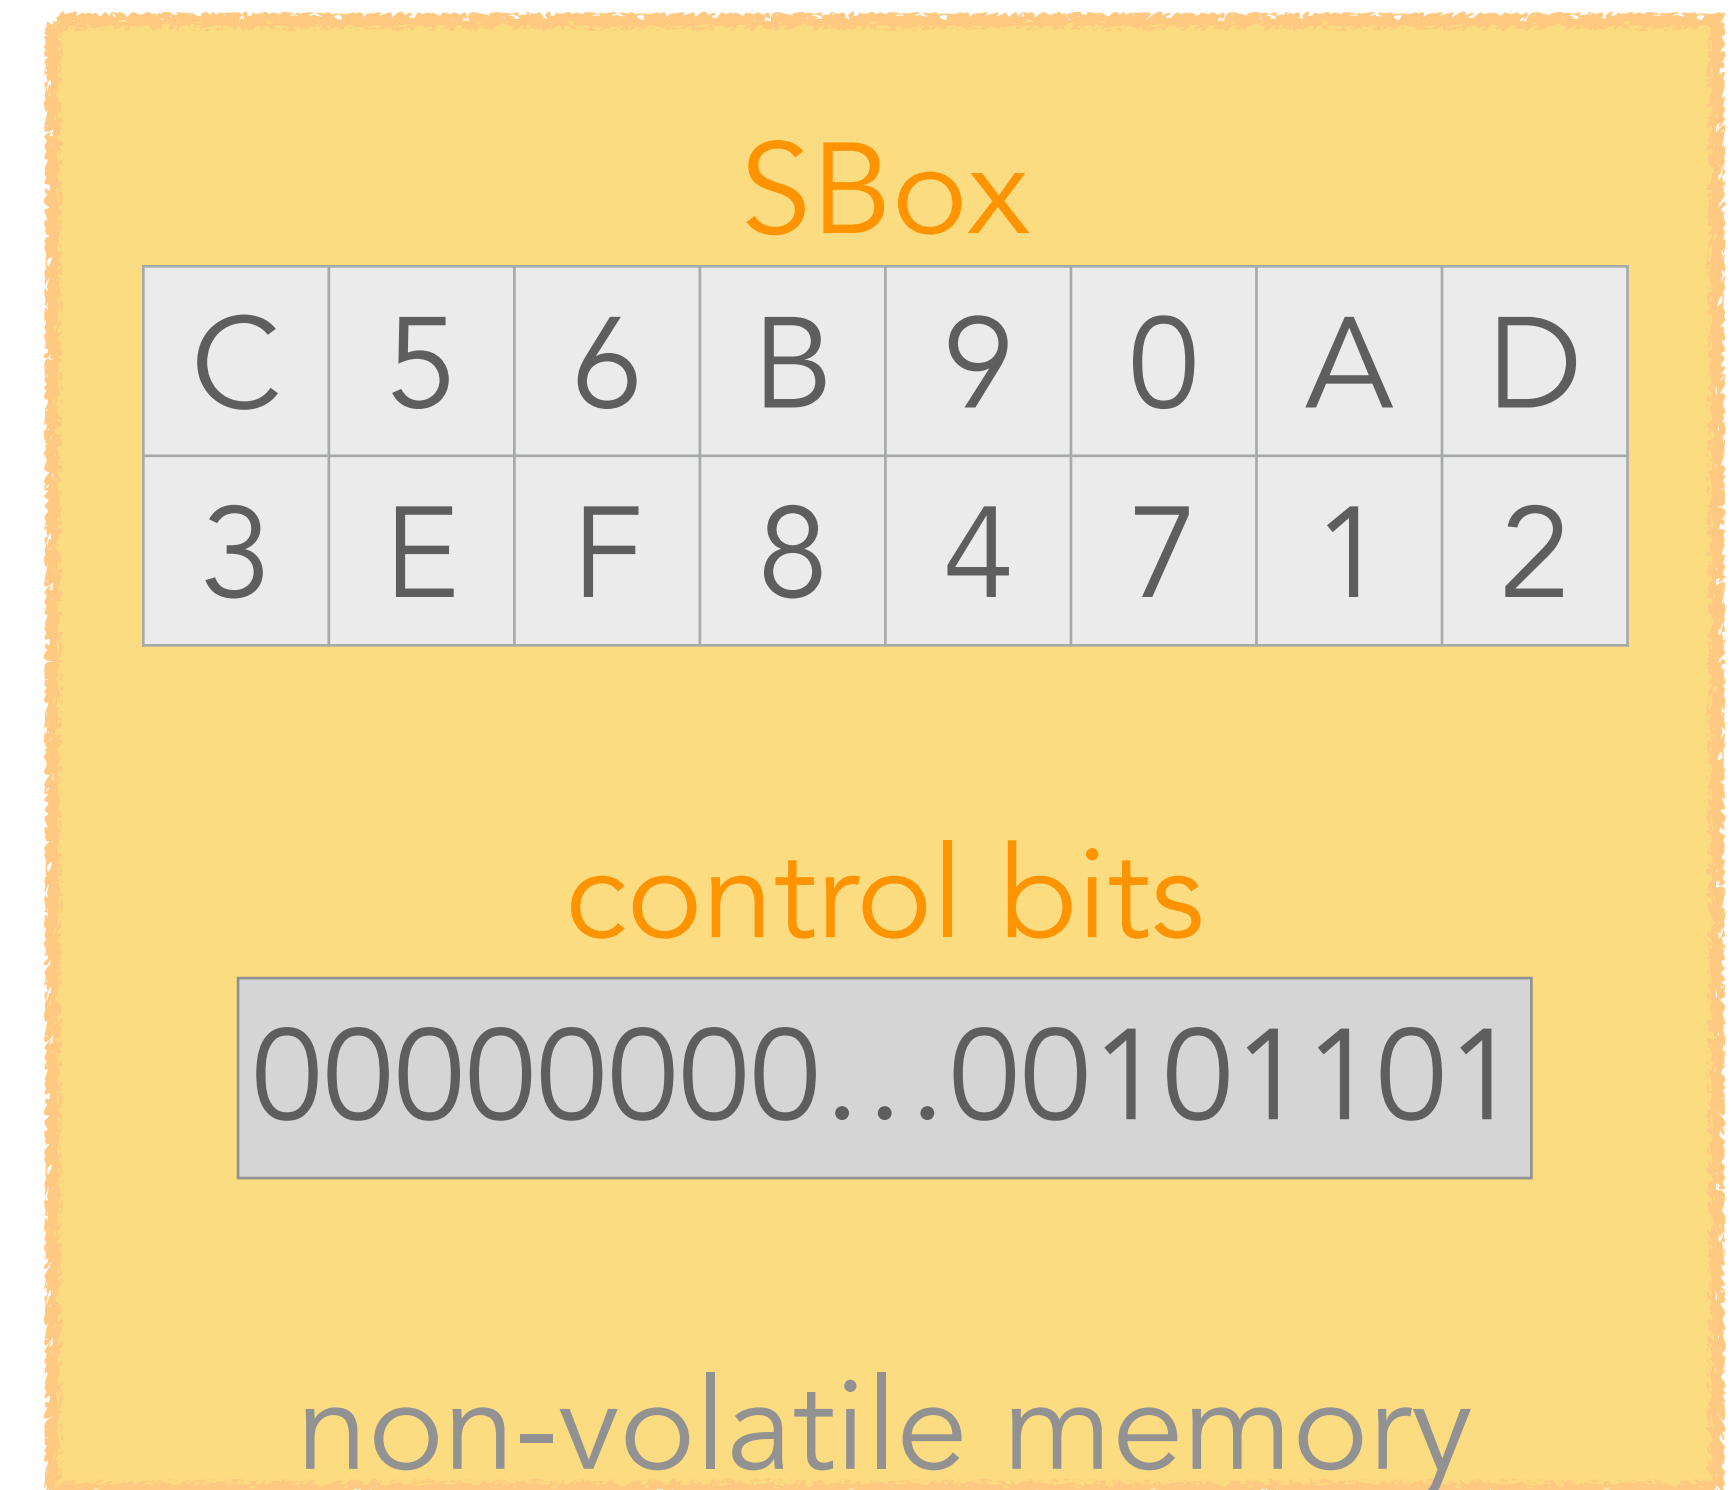

control bits: 010110

◆ PN computations [Bernstein, 2020]:

- ▶ PN \rightarrow Control bits
- ▶ Control bits \rightarrow PN

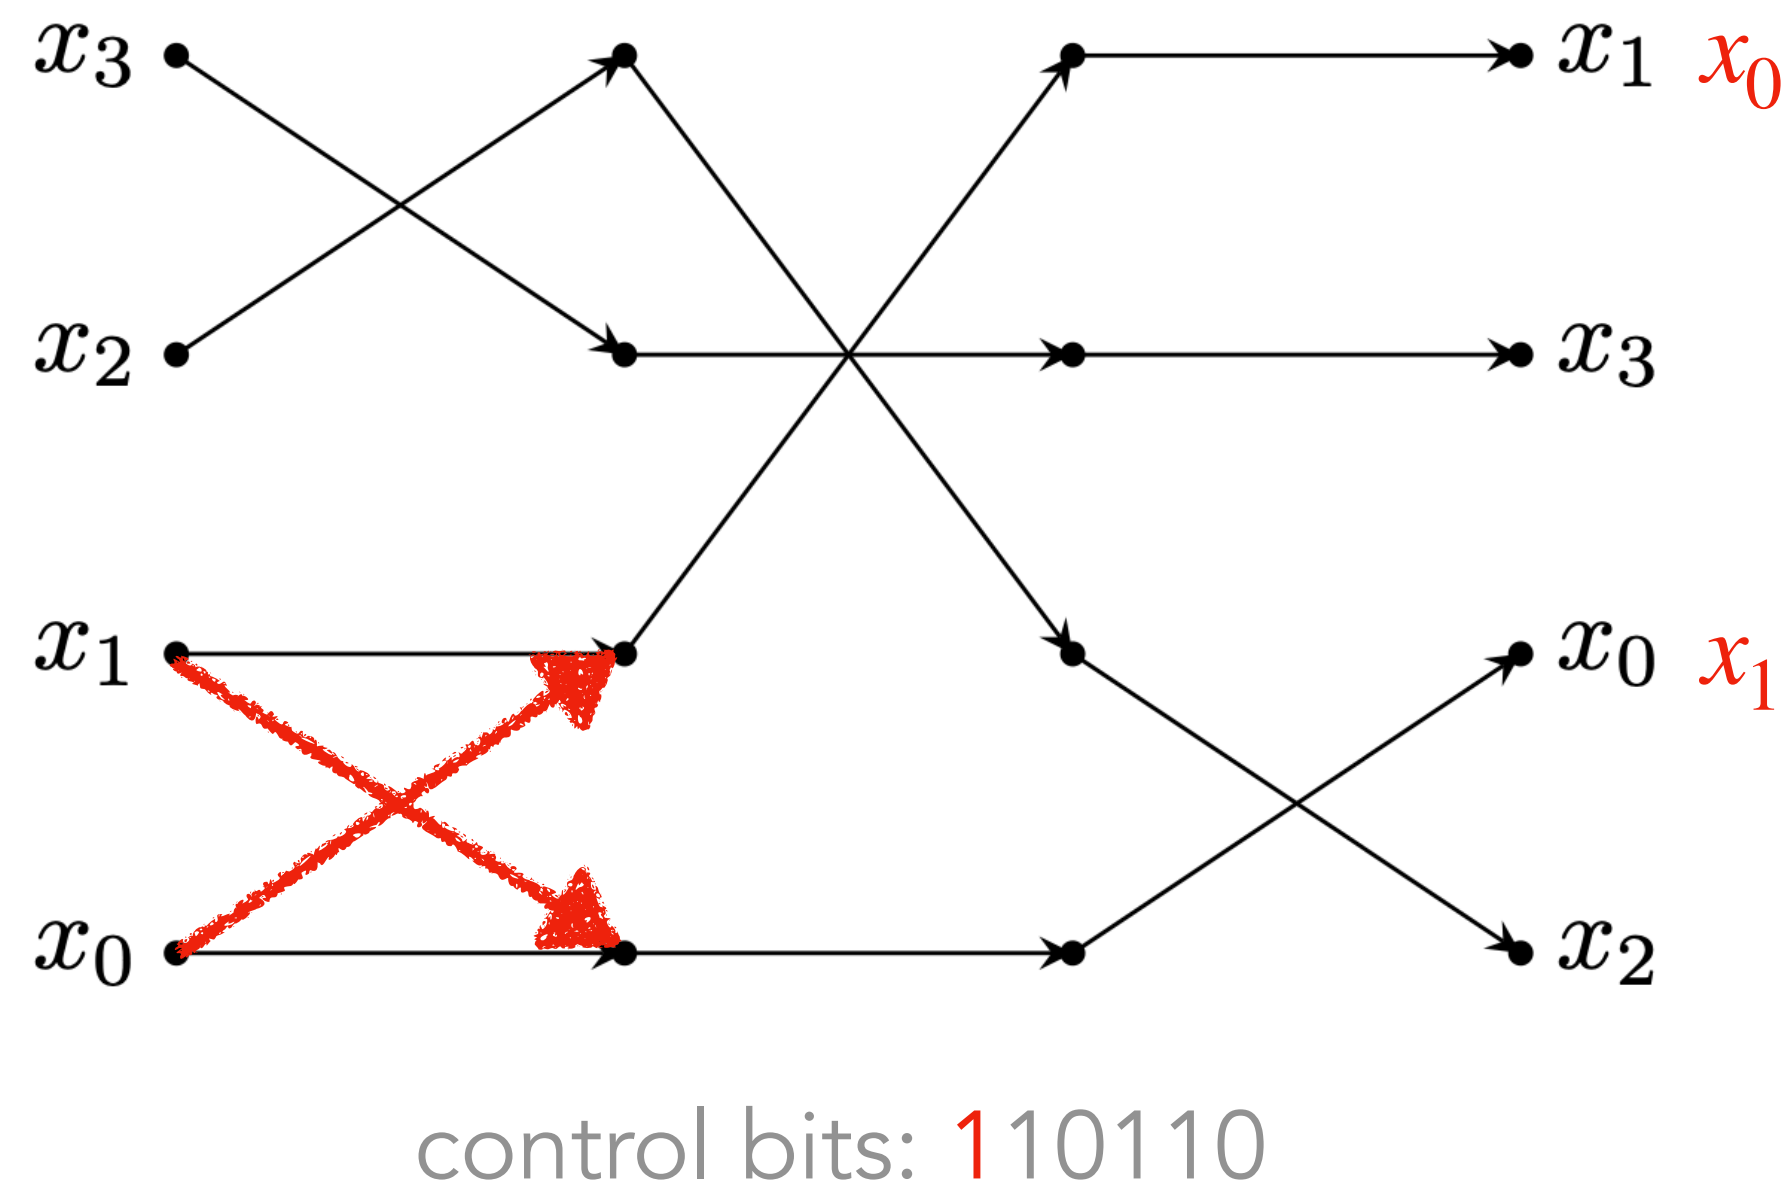

PN-based Countermeasure

- ◆ Control bits as redundancy
- ◆ Before encryption:
 - ▶ control bits → PN: SBox'
 - ▶ compare SBox' with SBox
- ◆ Seems good, but... 🤔

PN-based Countermeasure

◆ What if **both** SBox and control bits are faulted? 🤔

⚡ ⚡ SBox

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| C | 6 | 5 | B | 9 | 0 | A | D |
| 3 | E | F | 8 | 4 | 7 | 1 | 2 |

⚡ control bits

00100000...00101101

non-volatile memory

≥ 3 bitflips at precise locations to bypass !!! 😈

But still (always) able to detect **biased** faulty SBox ✅

Improved PN-based Countermeasure

| SBox | #bits | #controlbits | #bit1 (orig. SBox) | #bit1 (faulty SBox with 2 elements swapped) |
|-------------|-------|--------------|--------------------|---|
| AES | 8 | 1920 | 846 | {803, 805, 813, 829, 831, 833, 837, 839, 841, 843, 845, 847, 849, 851, 853, 855, 857, 859, 861, 863, 865, 867, 869, 871, 873, 877, 879, 881, 891} |
| PRESENT/LED | 4 | 56 | 18 | {15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37} |
| GIFT | 4 | 56 | 26 | {19, 21, 23, 25, 27, 29} |
| PRINCE | 4 | 56 | 22 | {19, 21, 23, 25, 27} |

#bit1 (orig. SBox) \notin {#bit1 (all faulty SBoxes with 2 elements swapped)}

✦ Indices of bit 1 (in control bits) as redundancy

► Attacker cannot change #bit1

SBox

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| C | 5 | 6 | B | 9 | 0 | A | D |
| 3 | E | F | 8 | 4 | 7 | 1 | 2 |

indices of bit1 in control bits

15, 25, 26, ..., 52, 53, 55

Improved PN-based Countermeasure

✦ Always able to detect

- ▶ biased faulty SBoxes ✓
- ▶ faulty SBoxes with 2 elements swapped ✓
- ▶ Simplify algorithm: control bits → PN 👍
(no need to traverse all swap gates)

✦ “In-place” property:

- ▶ Maintain an array for different layers
- ▶ Control bits must be processed **in order**

control bits: 010110
indices of bit1: [1, 3, 4]

Improved PN-based Countermeasure

◆ If inject faults on indices...

→ very challenging for attacker !!! 😈

rough est.: ≥ 4 bitflips at precise locations to bypass !!! 😈

CRC: Cyclic Redundancy Code

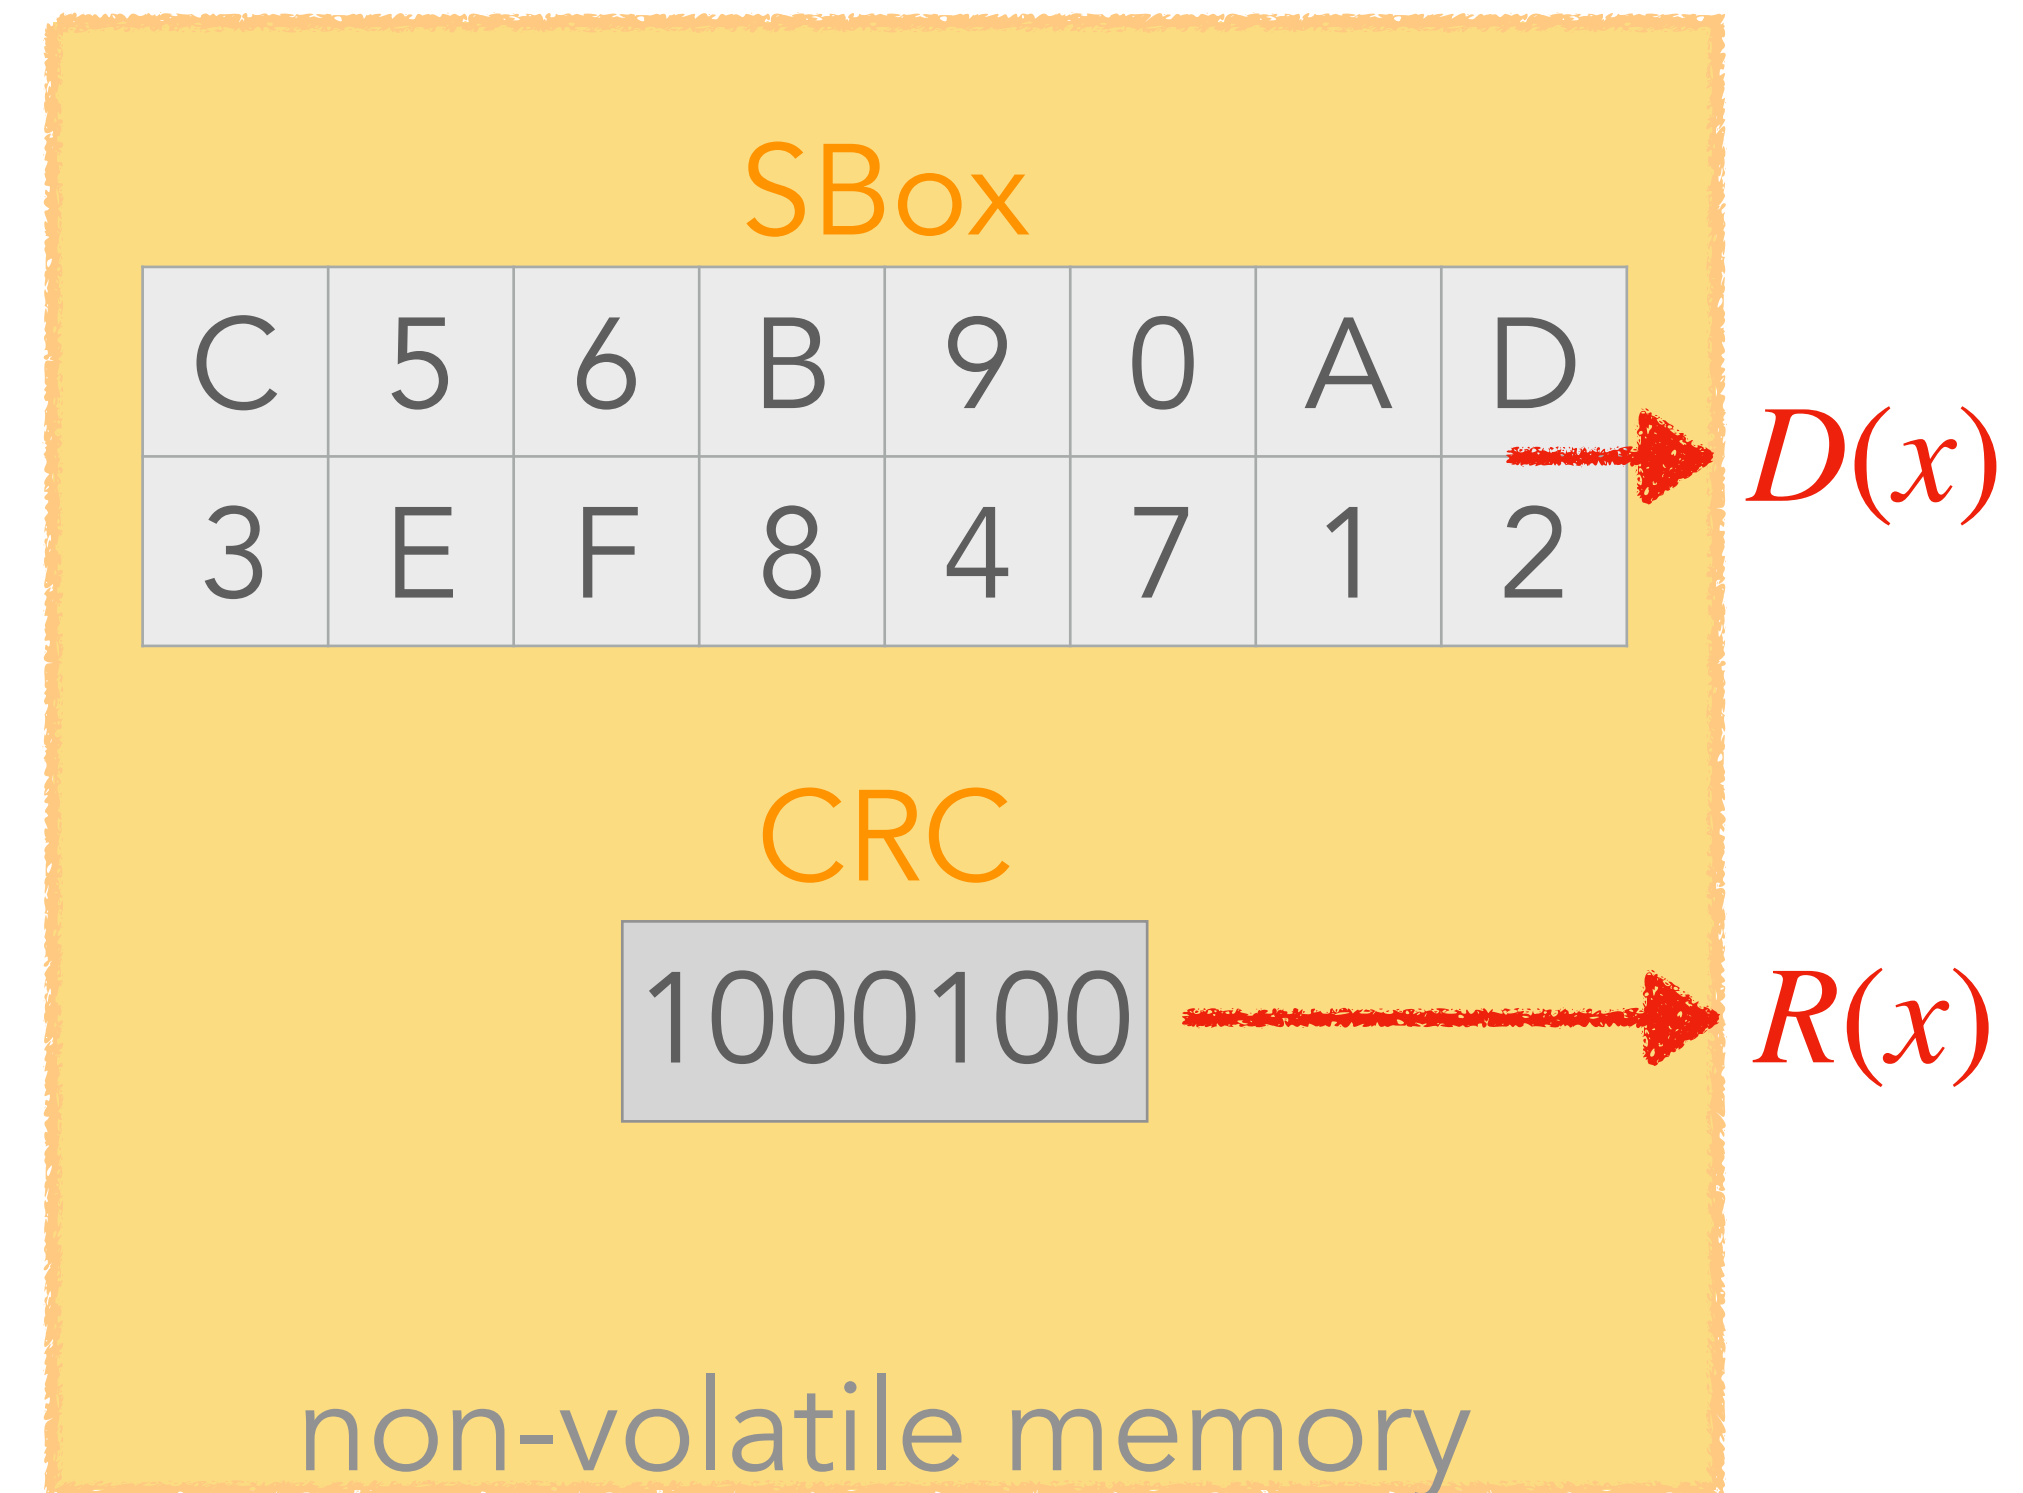

◆ Common method to protect data integrity

- ▶ k -bit data: $D(x)$
- ▶ generator polynomial (of degree $n - k + 1$): $P(x)$
- ▶ $(n - k)$ -bit redundancy:
$$R(x) = x^{n-k}D(x) \bmod P(x)$$
- ▶ to transmit/store: $T(x) = x^{n-k}D(x) + R(x)$

◆ Verification

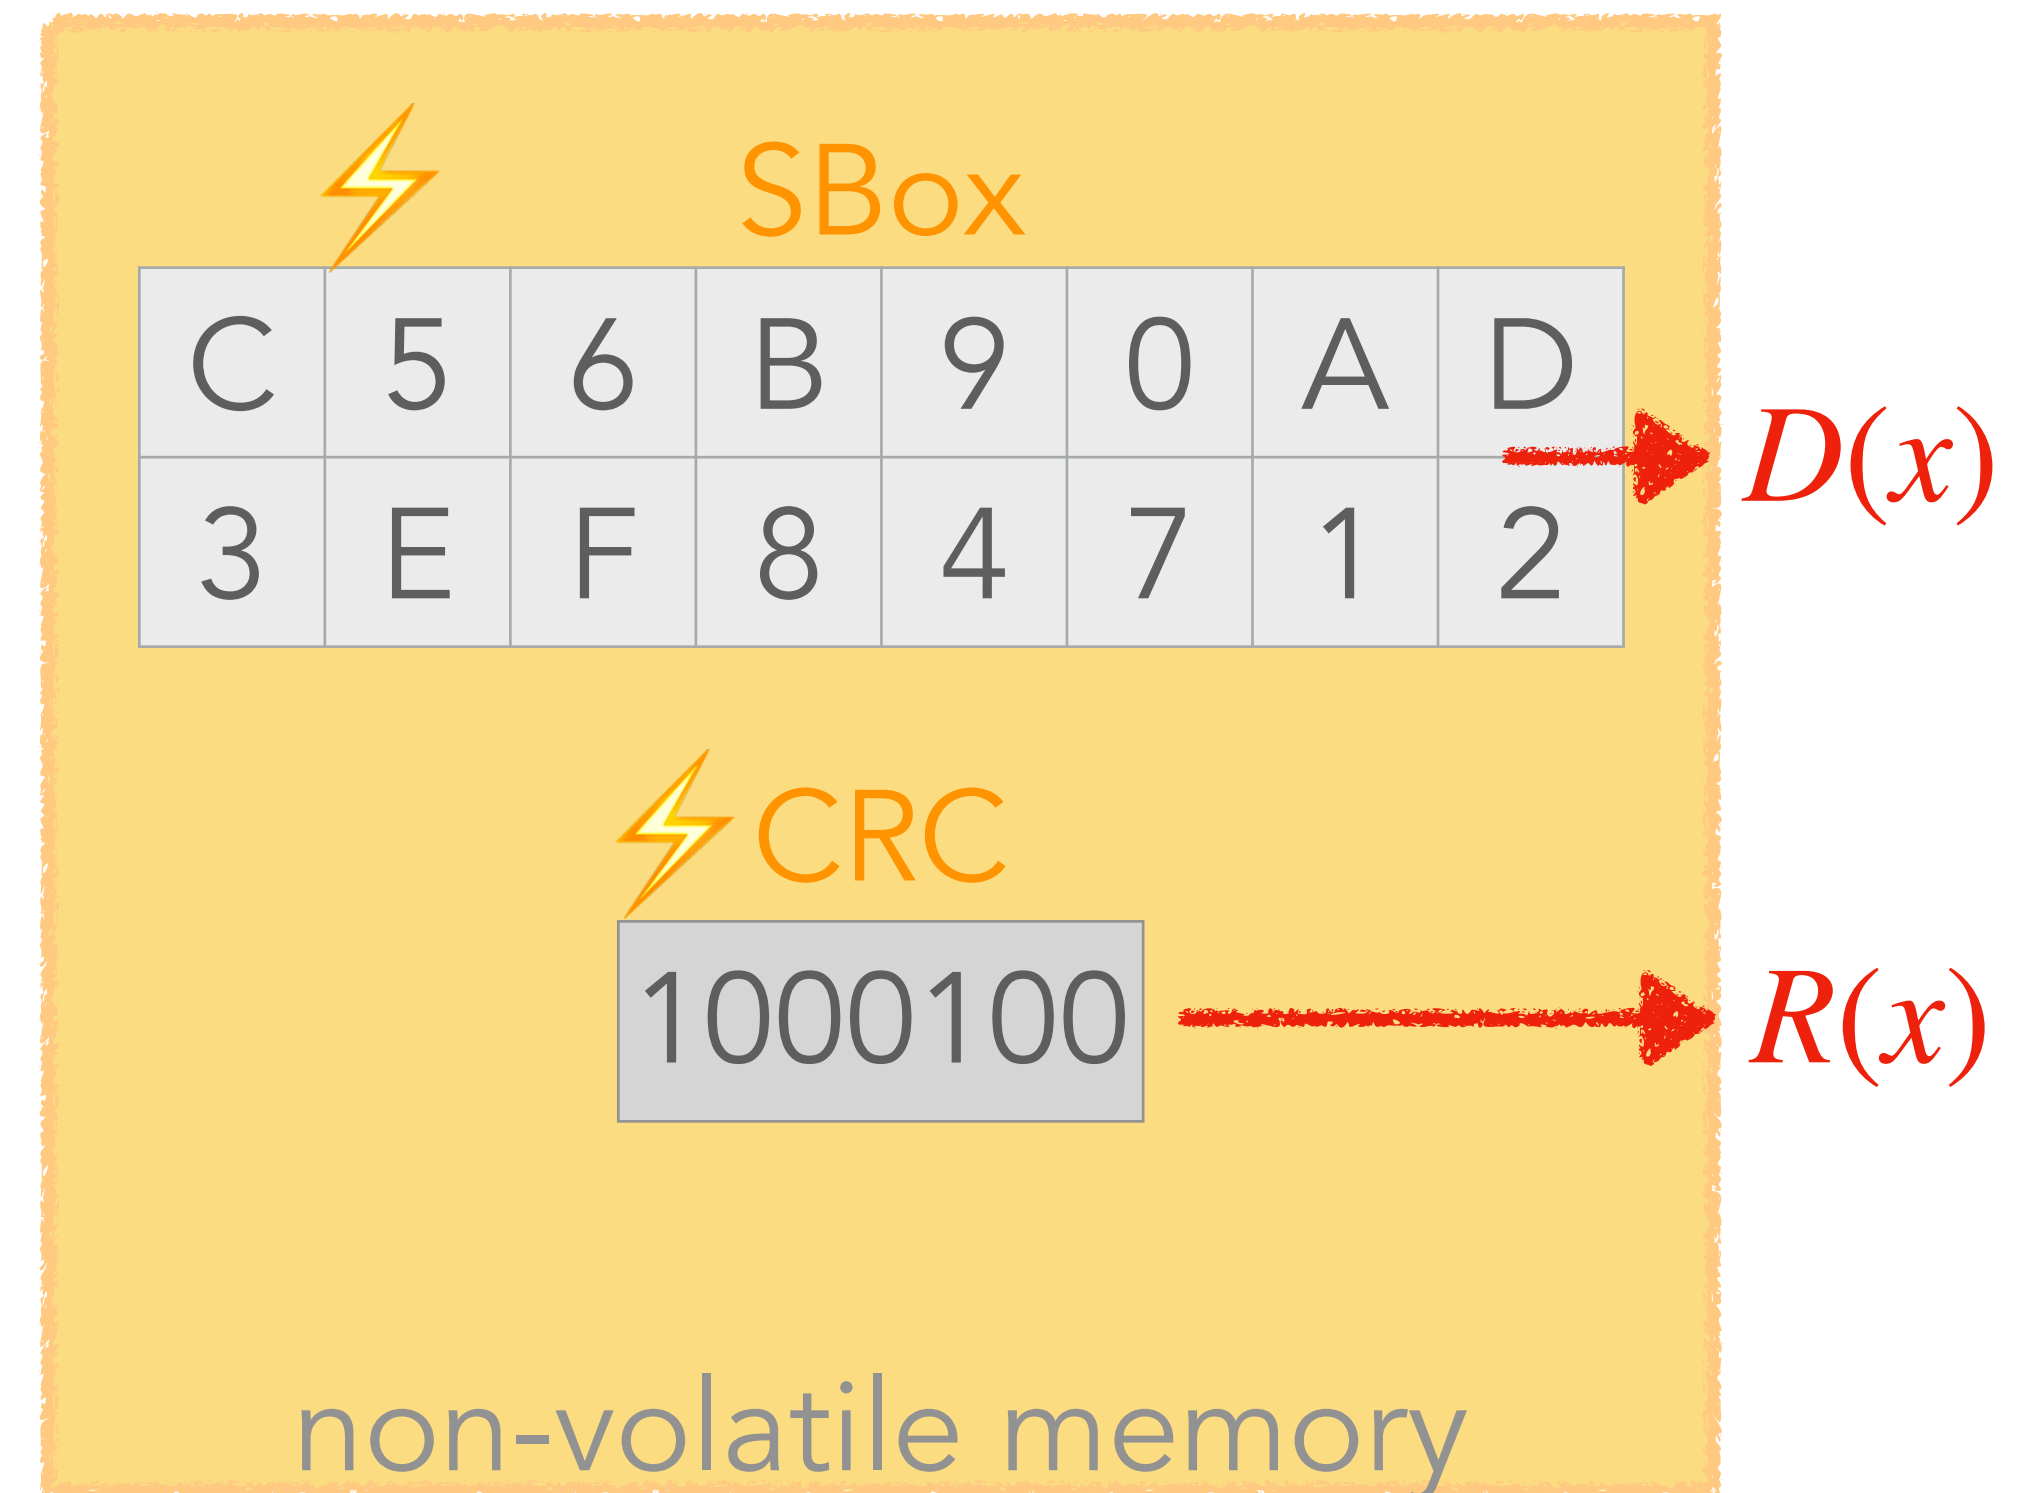

- ▶ $T(x) \bmod P(x) \stackrel{?}{=} 0$

◆ Efficient soft/hardware implementations

Choice of $P(x)$ [Koopman et al., 2004]

- ◆ 4-bit SBox: 0x97 - 8 bits $R(x)$
- ◆ 8-bit SBox: 0xC07 - 12 bits $R(x)$
- ◆ Advantage:
 - ▶ Detect any 1-, 2-, 3-bit errors

- ◆ What if faults on **both SBox and CRC?**

rough est.: ≥ 2 bitflips at precise locations to bypass !!! 🤩

Outlines

1. Context

- ▶ Previous PFA
- ▶ Our research questions

2. Countermeasures against biased faulty SBoxes

- ▶ BALoo
- ▶ Frequency Checking

3. Linear Cryptanalysis: PRESENT with non-biased faulty SBox

4. Stronger Countermeasures

- ▶ Permutation Network
- ▶ Cyclic Redundancy Code

5. Summary

Summary

- ◆ Detecting biased faulty SBoxes is not enough
- ◆ Linear Cryptanalysis with non-biased faulty SBoxes
- ◆ Stronger countermeasures:
 - ▶ PN-based
 - ▶ CRC-based

Summary

| Countermeasure | Biased Sbox | Non-biased SBox (2 elements swapped) | Non-biased SBox (3 elements swapped) |
|-------------------|-------------|---|---|
| Frequency Check | Yes / -- | No | No |
| BALoo | Yes / -- | Yes / -- | Yes / 3 |
| PN-based | Yes / -- | Yes / 3* | Yes / 4* |
| Improved PN-based | Yes / -- | Yes / -- | Yes / 4* |
| CRC-based | Yes / 2* | Yes / 3* | Yes / 4* |

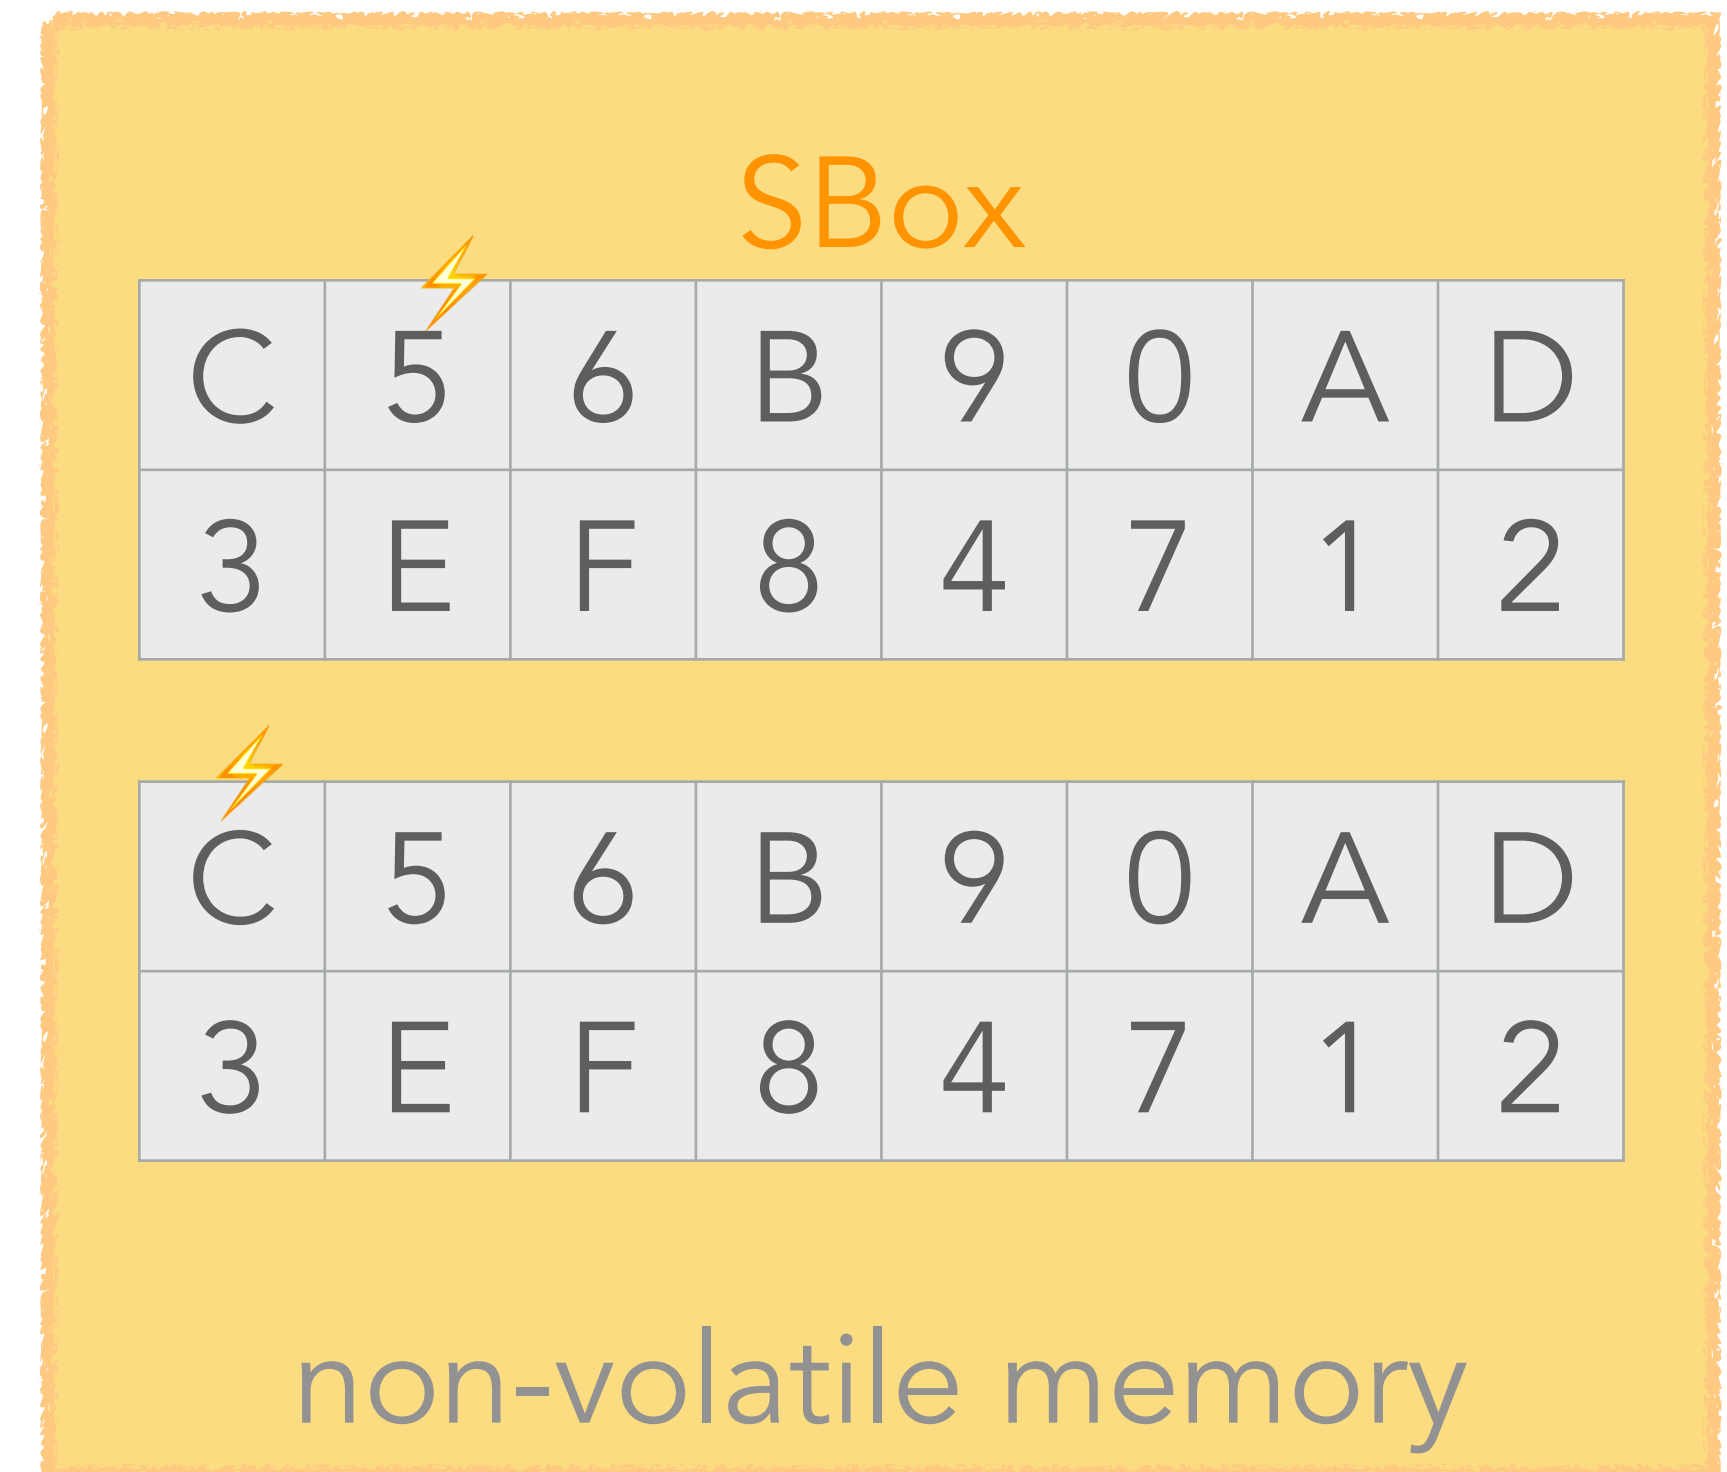

Thank you!

Any questions? 🤔

Appendix

Why not duplication ?

- ◆ High chance to be bypassed
 - ▶ Inject a fault in first SBox
 - ▶ Try to inject the same fault in second SBox at different locations until bypass

- ◆ Essential to have stronger countermeasures ! 💪

Algo: BALoo

Algorithm 1 BALoo countermeasure

Require: SBox \mathbf{S} , number of cycles s , starting indices $I[0], \dots, I[s - 1]$ and lengths $L[0], \dots, L[s - 1]$ corresponding to each cycle

Ensure: False in case of faulty SBox, True otherwise

```
1:  $t \leftarrow \text{False}$ 
2: for  $i$  from 0 to  $s - 1$  do
3:    $\ell \leftarrow 1$  ▷ Initialize length of the  $i$ -th cycle
4:    $j \leftarrow i$ 
5:   while  $\mathbf{S}[j] \neq I[i]$  and  $\ell < L[i] + 1$  do ▷ Traverse the  $i$ -th cycle
6:      $j \leftarrow \mathbf{S}[j]$ 
7:      $\ell \leftarrow \ell + 1$  ▷ Increment the length by 1
8:    $t \leftarrow t \vee \neg(\ell \stackrel{?}{=} L[i])$  ▷ Check if the length is correct
return  $\neg t$ 
```

Algo: Frequency Check

Algorithm 2 Frequency checking countermeasure

Require: SBox \mathbf{S} and its number of elements n

Ensure: **False** in case of faulty SBox, **True** otherwise

- 1: $D = (0, \dots, 0)$ ▷ Initialization of frequency list by n zeros
 - 2: **for** i from 0 to $n - 1$ **do**
 - 3: $D[\mathbf{S}[i]] \leftarrow D[\mathbf{S}[i]] + 1$ ▷ Increment the frequency by 1
 - 4: $t \leftarrow \mathbf{False}$
 - 5: **for** i from 0 to $n - 1$ **do**
 - 6: $t \leftarrow t \vee \neg(D[i] \stackrel{?}{=} 1)$ ▷ Check if the frequency is 1
- return** $\neg t$
-

Algo: PN-based Countermeasure

Algorithm 4 First version of PN-based countermeasure

Require: SBox \mathbf{S} , its bit length m , control bits $c[0], \dots, c[2^m(m-1/2)]$

Ensure: False in case of faulty SBox, True otherwise

```
1:  $n \leftarrow 1 \lll m$  ▷ Number of elements
2:  $g \leftarrow 1 \lll (m - 1)$  ▷ Number of swap gates in each layer
3:  $\pi \leftarrow (0, \dots, n - 1)$ 
4: for  $i$  from 0 to  $2m - 2$  do ▷  $i$ -th layer
5:    $\Delta \leftarrow 1 \lll \min(i, 2m - i - 2)$  ▷ Gap between two elements of a gate in  $i$ -th layer
6:   for  $j$  from 0 to  $g - 1$  do
7:     if  $c[ig + j] = 1$  then
8:        $l \leftarrow (j \bmod \Delta) + 2\Delta \lfloor j/\Delta \rfloor$  ▷ Smaller index in two elements
9:       swap  $\pi[l]$  and  $\pi[l + \Delta]$ 
10:  $t \leftarrow \text{False}$ 
11: for  $i$  from 0 to  $n - 1$  do
12:    $t \leftarrow t \vee \neg(\mathbf{S}[i] \stackrel{?}{=} \pi[i])$  ▷ Compare  $\pi$  and  $S$ 
return  $\neg t$ 
```

Algo: Improved PN-based Countermeasure

Algorithm 5 Improved version of PN-based countermeasure

Require: SBox \mathbf{S} , its bit length m , list $\mathcal{D} = \{v_0, v_1, \dots, v_{|\mathcal{D}|}\}$, where $v_0 < v_1 < \dots < v_{|\mathcal{D}|}$, of indices corresponding to control bits 1

Ensure: **False** in case of faulty SBox, **True** otherwise

```
1:  $n \leftarrow 1 \lll m$  ▷ Number of elements
2:  $g \leftarrow 1 \lll (m - 1)$  ▷ Number of swap gates in each layer
3:  $\pi \leftarrow (0, \dots, n - 1)$ 
4: for each  $v$  in  $\mathcal{D}$  do
5:    $i \leftarrow \lfloor v/g \rfloor$  ▷  $i$ -th layer
6:    $j \leftarrow v \bmod g$  ▷  $j$ -th swap gate
7:    $\Delta \leftarrow 1 \lll \min(i, 2m - i - 2)$  ▷ Gap between two elements of  $j$ -th gate
8:    $l \leftarrow (j \bmod \Delta) + 2\Delta \lfloor j/\Delta \rfloor$  ▷ Smaller index in two elements
9:   swap  $\pi[l]$  and  $\pi[l + \Delta]$ 
10:  $t \leftarrow \mathbf{False}$ 
11: for  $i$  from 0 to  $n - 1$  do
12:    $t \leftarrow t \vee \neg(\mathbf{S}[i] \stackrel{?}{=} \pi[i])$  ▷ Compare  $\pi$  and  $S$ 
   return  $\neg t$ 
```

Algo: CRC-based Countermeasure

Algorithm 6 CRC-based countermeasure

Require: Bitstring of data $T[0..(L-1)]$ (SBox elements and redundancy) and coefficients of generator polynomial $G[0..p]$ ($G[0]$ is the coefficient of x^p)

Ensure: False in case of faulty SBox, True otherwise

1: $r[0..(p-1)] \leftarrow (0..0)$

▷ Initialize reminder

2: **for** i from 0 to $L-1$ **do**

3: $r \leftarrow r \oplus (T[i] \ll (p-1))$

4: $r \leftarrow r \ll 1$

5: **if** $r[0] = 1$ **then**

6: $r \leftarrow r \oplus G[1..p]$

return $(r \stackrel{?}{=} 0)$

▷ Verify if reminder is 0
